

EVENTFORCE MANAGEMENT SYSTEM

Final Project Document

Salesforce Implementation | Event Planning & Operations

Project Focus	Centralized event planning, client coordination, venue booking, vendor assignment, approvals, reminders and feedback.
Platform	Salesforce Developer Edition / Lightning Experience
Core Modules	Event • Client • Vendor • Venue • Feedback • EventVendor
Implementation Style	Declarative automation + Apex business logic + security + analytics

Prepared as a consolidated academic implementation report. The original reference material has been reorganized, condensed and visually reformatted for a distinct project-document presentation.

Contents

Compact structure — designed as a submission document rather than a page-for-page reproduction.

Section	Topic
1	User Story & Executive Summary
2	Project Overview and Purpose
3	Ideation and Problem Definition
4	Requirements and Customer Journey
5	Solution Architecture
6	Data Model and Field Design
7	Project Planning & Agile Execution
8	Salesforce Development
9	Automation and Approval Workflow
10	Apex Business Logic
11	Lightning UI, Reports & Dashboard
12	Data Migration & Security
13	Testing and Validation
14	Outcomes, Limitations & Future Scope
15	Appendix and Submission Checklist

Document approach

The content keeps the project's original functional scope but uses a shorter narrative, tighter spacing, new section sequencing, refreshed diagrams, and selected implementation snapshots.

1. User Story & Executive Summary

the major stages of event planning into one workspace. The system covers client registration, event creation, venue selection, vendor coordination, reminders, cancellation approvals, feedback and operational reporting.

Primary user story

As an event coordinator, I want one place to create and track events, connect clients and venues, assign vendors, receive automated reminders, manage cancellation approvals and monitor outcomes, so that event operations can be coordinated with less manual effort and fewer booking conflicts.

Supporting user stories

- As a client, I want my event details and reminders to be managed consistently so I know what is scheduled.
- As a venue manager, I want the system to prevent conflicting venue reservations on the same date.
- As a vendor manager, I want to assign multiple vendors to an event and see their involvement clearly.
- As an administrator, I want controlled approval, security and reporting so that operational data remains reliable.

Expected value

Centralized records + controlled automation + venue validation + role-based access + operational analytics.

2. Project Overview and Purpose

The project uses Salesforce custom objects, relationships, validation rules, formula fields, record-triggered flows, an approval process, Apex triggers/classes, batch and scheduled Apex, a Lightning app, reports, dashboards and security configuration.

Project objectives

- Centralize Events, Clients, Vendors, Venues and Feedback.
- Reduce manual coordination across booking and communication activities.
- Maintain venue availability and reduce double-booking risk.
- Automate reminders and cancellation approvals.
- Provide controlled access for administrators, coordinators, vendor managers and clients.
- Provide reports and dashboards for operational visibility.

Scope snapshot

Area	Included in the implementation
Data	Event, Client, Vendor, Venue, Feedback and EventVendor records
Automation	3-day reminder, cancellation approval, venue status, completion processing
Apex	VenueStatusHelper, EventTrigger13, double-booking validation, batch/scheduled processing
UI	Event Planner Management System Lightning app
Analytics	Upcoming Events by Month report and EventForce Operations Dashboard
Security	Profiles, roles, permission set, OWD and sharing rule

3. Ideation and Problem Definition

Problem statements

User	Need	Operational pain
Event Operations Manager	It is difficult to manage client, event, venue, and vendor information	Reminder and event vendor information centrally
Event Coordinator	Event details, client coordination, and event reservations centrally	Cancellation client information and mature require require
Venue Manager	The venue manager bayowed to assign to multiple events	Cancellation requests, capacity, availability status
Vendor Manager	Vendor details and event assignments need to vendor information	Overadament and event mendor information centrally
Client	Feedback information and concerns	Reminders have to handled manually.
Administrator	Cancellation requests needs to matte approval satisfatatus	Cancellation requests require approval and updates

Empathy-map summary

Think/Feel Frustrated to message client, feel/no event, client, seerznd concernent	See See versaal information client, event, vense, anderasmerees, and venue, vendor information centrally
Hear / Do Event details, client coordinaiton, and mane events reservation multiple require	Pain Frustrated person needs to customer concerned
Gain / Gain Organized and loss confided is easily visible in to place	

3. Ideation and Problem Definition

The project was shaped around a common event-management problem: information is often distributed across people, messages and separate tracking methods. The Salesforce solution treats the event record as the central operational anchor and connects related clients, venues, vendors and feedback.

Problem statements

User	Need	Operational pain
Event Operations Manager	Central oversight	Event, venue, client and vendor information is difficult to maintain in one place.
Event Coordinator	Fast booking workflow	Booking details and communication require repeated manual actions.
Venue Manager	Accurate availability	The same venue can be considered for overlapping bookings.
Vendor Manager	Assignment tracking	Services and vendor assignments need a structured relationship with events.
Client	Timely communication	Reminders and event updates can be missed when handled manually.
Administrator	Controlled cancellation	Cancellation decisions need a clear approval path and status history.
Management	Visibility	Operational information needs reports and dashboards for review.

Empathy-map summary

Think / Feel	See	Hear / Do	Pain / Gain
Wants smooth coordination and reliable service	Event details, client details, venue availability	Vendor assignments, event details, client details	Pain: Manual data entry, updates, cancellations, and G

3.1 Idea Prioritization

Option	Strength	Limitation	Decision
Manual registers	Simple to start	Time-consuming and difficult to maintain	Not selected
Spreadsheet tracking	Easy to share	Limited automation and live coordination	Not selected
Standalone portal	Tailored user experience	Higher build and maintenance effort	Not selected
Salesforce CRM	Automation, centralized data, Reporting and analytics	Needs proper configuration	Selected

Why Salesforce fits this project

- Custom objects provide a structured event-management data model.
- Flows handle time-based and record-based automation.
- Apex can enforce rules that span multiple records.
- Approval Processes provide controlled cancellation handling.
- Lightning apps, reports and dashboards give operational visibility.
- Profiles, roles, permissions and sharing controls support differentiated access.

EventForce
Management System
Plan - Coordinate - Create Memorable Experiences

Brainstorming & Idea Prioritization

Exploring options to find the best solution for EventForce

From Ideas to Impact

Ideas Considered

Manual Registers

Maintain event, client, venue, and vendor details manually.

Key Limitation
Time-consuming and difficult to maintain.

Spreadsheet Tracking

Track bookings and event information using spreadsheets.

Key Limitation
Limited automation and real-time coordination.

Standalone Portal

Develop a dedicated portal for event management.

Key Limitation
Higher development and maintenance effort.

Salesforce CRM

Centralize event operations on a Salesforce platform.

Key Consideration
Requires proper configuration and implementation.

Final Selection

Salesforce CRM

Selected as the preferred solution for EventForce.

Why Salesforce CRM?

Automation
Automates reminders, approvals, status updates, and business processes.

Scalability
Supports expanding event operations, users, records, and business requirements.

Real-Time Visibility
Provides centralized data, reports, and dashboards for operational monitoring.

A Smarter Way to Manage Events

Centralized. Automated. Scalable. Successful Events.

Right Idea. Brighter Events.

PEOPLE | PLACES | POSSIBILITIES

4. Requirements and Customer Journey

Functional requirements

ID	Requirement	Description
FR-01	Event management	Create and maintain event records.
FR-02	Client management	Maintain client contact and location information.
FR-03	Venue management	Track venue capacity and availability.
FR-04	Vendor management	Maintain vendor services and status.
FR-05	Event-vendor assignment	Support many vendors for an event through a junction object.
FR-06	Booking validation	Prevent same-venue conflicts for the same event date.
FR-07	Reminder automation	Send a client reminder three days before a confirmed event.
FR-08	Cancellation approval	Route pending cancellations through approval.
FR-09	Feedback	Capture rating/comments linked to event and client.
FR-10	Analytics	Provide reports and dashboards.
FR-11	Completion	Mark past events as completed.
FR-12	Data migration	Load validated records through Salesforce import tools.

4.1 Customer Journey

Stage	System interaction	Result
1. Enquiry	Client information is captured.	Client record is available.
2. Planning	Event type, date, status and budget are recorded.	Structured event plan.
3. Venue	Availability is checked and venue is associated.	Reservation conflict is reduced.
4. Vendors	One or more vendors are linked through EventVendor.	Services are coordinated.
5. Confirmation	Event becomes Confirmed and reminder automation becomes relevant.	Client communication is scheduled.
6. Execution	Status and operational records are monitored.	Live operational view.
7. Cancellation	Request moves through approval.	Controlled decision and notification.
8. Closure	Feedback is captured and past events are completed.	Historical information remains usable.

5. Solution Architecture

The solution follows a layered Salesforce design: users work through Lightning; the data model stores the operational records; declarative automation handles common workflows; Apex handles cross-record business rules; security controls determine visibility; and reports/dashboards expose operational information.

- Lightning App / Users
- Custom Objects + Relationships
- Flows + Approval Process
- Apex Triggers + Classes
- Security + Sharing
- Reports + Dashboard

Primary flow

Input	Processing	Output
Client / Event Team	Create or update records	Event + Client + Venue + Vendor data
Event record	Validation + automation	Reminder / approval / status changes
Venue + date	Apex validation	Booking accepted or blocked
Operational data	Reports and dashboard	Monthly and management visibility

6. Data Model and Field Design

The data model uses six custom objects. Event is the operational hub. EventVendor acts as the junction object for the many-to-many Event-Vendor relationship. Feedback connects back to both Event and Client.

Object	Key fields / purpose	Relationship role
Event__c	Name, Event Date, Event Type, Event Status, Event Budget	Lookup to Client and Venue
Client__c	Name, Email, Phone, Address, Country, City	Parent reference for event/feedback
Vendor__c	Name, Email, Phone, Service Type, Status	Connected through EventVendor
Venue__c	Name, Address, Location, Capacity, Availability Status	Selected for an event
Feedback__c	Auto number, Rating, Comments	Lookup to Event and Client
EventVendor__c	Event + Vendor master-detail links	Many-to-many junction

Relationship map

Parent / Source	Relationship	Target
Event	Lookup	Client
Event	Lookup	Venue
Feedback	Lookup	Event
Feedback	Lookup	Client
EventVendor	Master-Detail	Event
EventVendor	Master-Detail	Vendor

6.1 Field Design Highlights

Event Type

Value set

Wedding • Corporate • Birthday • Anniversary • Festival • Concert • Other

Event Status

Status

Planned • Confirmed • Completed • Pending Cancellation • Canceled • Rejected

Other key field groups

Object	Examples
Client	Email, Phone, Address, Country, City
Vendor	Service Type (multi-select), Email, Phone, Status
Venue	Address, Location URL, Capacity, Availability Status
Feedback	Rating 1-5, Comments

6.2 Validation and Formula Logic

Validation rules are used where the platform should stop an invalid record from being saved. The project also uses a formula field to derive an event budget from event type.

Rule / Formula	Object	Purpose
Email_Valid_Address	Client__c	Checks the client email pattern before save.
Valid Event Date	Event__c	Stops an invalid event date from being accepted where the business rule ap
Required Client / Venue	Event__c	Ensures the required relationships exist for applicable statuses.
Event Budget formula	Event__c	Calculates a standard budget from Event Type.

Budget formula used in the reference implementation

```
CASE(TEXT(Event_Type__c), "Wedding", 50000, "Corporate", 30000, "Birthday", 10000, "Anniversary", 20000, "Festival", 60000, "Concert", 40000, "Other", 15000, 0)
```

Design note

The report intentionally documents the business logic in a compact form instead of repeating every Salesforce Setup click from the reference material.

7. Project Planning & Agile Execution

The project follows an Agile-style plan using epics, user stories, story points and short sprints. The implementation is organized so that the data model is established first, followed by automation, business logic, security and analytics.

Sprint	Story	Points	Priority
1	Create event records with standardized type/date/status	3	High
1	Associate client and venue with an event	5	High
2	Assign multiple vendors to an event	5	High
2	Send timely event reminders	3	High
3	Control cancellation through approval	5	High
3	Prevent venue double booking	8	High
4	Apply role-based access	5	High
4	Create reports and dashboards	5	Medium

Implementation sequence

- Foundation → objects, fields and relationships
- Automation → flows and approval
- Business logic → Apex validation and status updates
- Experience → Lightning app and analytics
- Readiness → data migration, security and testing

8. Salesforce Development

The development phase converts the requirements into a working Salesforce configuration. The implementation uses a mix of declarative configuration and Apex so that simple workflow rules remain maintainable while cross-record logic is handled programmatically.

Development milestones

M1	Developer Org	Create/activate Salesforce Developer Edition.
M2	Objects	Create Event, Client, Vendor, Venue and Feedback; create EventVendor junction.
M3	Tabs	Expose custom objects through Salesforce tabs.
M4	Fields & Relationships	Add fields and lookup/master-detail relationships.
M5	Validation	Add email validation and event data checks.
M6	Approval	Create Event_Cancellation_Process.
M7	Flows	Create the 3-day client reminder.
M8-10	Apex	Venue status, double-booking, batch completion and schedule.
M11-13	UI & Analytics	Lightning app, report and dashboard.

8.1 Salesforce Object Setup Snapshot

The EventForce build starts with the Salesforce Developer Edition and Object Manager. Custom objects are then created with report/search support and appropriate record names.

Activity 2: Account Activation

1. Go to the inbox of the email that you used while signing up. Click on the verify account to activate your account. The email may take 5-10mins.

2. Click on Verify Account
3. Give a password and answer a security question and click on change password.

Implementation snapshot: the reference configuration was used as evidence, but this report reorganizes the setup into a compact implementation view.

8.2 Data Model / Object Configuration Snapshot

The object layer is kept intentionally simple: Event acts as the main transaction record, while Client, Venue, Vendor and Feedback hold related information.

5. Feedback__c
(Fields: Feedback ID (Auto Number), Rating, Comments)
6. EventVendor__c (Junction Object)
(Links Event ↔ Vendor for Many-to-Many relationship)

Relationships:

Relationship	Type
Event → Client	Lookup
Event → Venue	Lookup
Feedback → Event	Lookup
Feedback → Client	Lookup
EventVendor → Event	Master-Detail
EventVendor → Vendor	Master-Detail

Implementation snapshot: object and field configuration evidence.

8.3 Field and Relationship Configuration

EventVendor implements the many-to-many Event-Vendor relationship using two master-detail relationships. Event and Client, Event and Venue, and Feedback lookups complete the core model.

Create Many-to-Many Relationship (Event ↔ Vendor)

Salesforce doesn't allow direct many-to-many, so we create a **junction object** (EventVendor__c) :

Go to Object Manager → Create New Custom Object

- Label: Event Vendor
- Object Name: EventVendor__c

From Setup, go to Object Manager , Select Event Vendor Object

Implementation snapshot: junction-object configuration for EventVendor.

9. Automation and Approval Workflow

Cancellation requests use a controlled approval path. A Pending Cancellation status acts as the entry condition. The approval stage assigns a reviewer, while final approval or rejection updates the event status and can send notification emails.

Step	State / Action	Result
1	Coordinator requests cancellation	Event status = Pending Cancellation
2	Approval entry criteria evaluated	Request enters approval process
3	Manager review	Approver sees key event information
4A	Approved	Status = Canceled; notification sent
4B	Rejected	Status = Rejected; owner notified

Approval process name

Event_Cancellation_Process

9.1 Approval Process Configuration Snapshot

The implementation uses email templates for the cancellation request, approval notification and rejection notification. This creates a traceable communication path around the approval decision.

Action	Email Template Name	Template Type	Available For Use	Description	Author	Last Modified Date
108 (24)	Appointment For Unauthenticated User with Appointment Types - CANCELLATION REQUEST	Custom	✓	Email template for confirmation of an appointment when appointments are scheduled using appointment types with Appointment CTRM.	afk@adobe.com	4/13/2025
108 (24)	Appointment For Unauthenticated User with Appointment Types - CANCELLATION REQUEST	Custom	✓	Email template for confirmation of an appointment when appointments are scheduled using appointment types with third party video applications.	afk@adobe.com	4/13/2025
108 (24)	Appointment For Unauthenticated User with Appointment Types - CANCELLATION REQUEST	Custom	✓	Email template for confirmation of an appointment when appointments are scheduled using engagement channels with Appointment CTRM.	afk@adobe.com	4/13/2025

5. You'll now choose the type of email template you want to create.

Choose the type:

- Text – Plain text (no formatting)
- Click Next

6. Email Template Information:

Folder	Public or private folder (use "Unfiled Public Email Templates" for now)
Email Template Name	Event Cancellation Request Notification
Template Unique Name	Auto-filled, or change it (no spaces)
Encoding	Leave default (UTF-8)
Subject	Approval Request: Cancel Event {!Event__c.Name}

Implementation snapshot: approval email/configuration evidence.

9.2 Approval Step Snapshot

The manager review step is configured after the entry criteria and before the final approval/rejection actions.

A screenshot of the initial approval step configuration interface. It features two dropdown menus, both set to 'None', and a text input field. Below these is a label 'Add Title Log...'. At the bottom right, there are four buttons: 'Previous', 'Save', 'Next', and 'Cancel'.

Step 2: Select Approver

Option 1: Use a specific user

- Select: Automatically assign using user or queue
- Choose: A specific user (Manager)

Option 2: Use Manager of the user

- Select: Automatically assign to the manager of the user who submitted the record
- (Make sure users have a manager assigned in their User record)
- Click Next

A screenshot of the 'Step 3: Specify Approver Field and Record Editability Properties' configuration screen. The title bar indicates 'Step 3 of 8'. The main content area includes a text box with instructions: 'When you define approval steps, you can assign approval requests to different users. One of your options is to use a user field to automatically route these requests. If you want to use this option for any of your approval steps, select a field from the picklist below. Also, when a record is in the approval process, it will always be locked - only an administrator will be able to edit it. However, you may choose to also allow the currently assigned approver to edit the record.' Below this is a section titled 'Select Field Used for Automated Approval Routing' with a dropdown menu set to 'Manager'. There is also a checkbox labeled 'Use Approver Field of Event Owner'. The 'Record Editability Properties' section has two radio buttons: 'Administration ONLY can edit records during the approval process.' (selected) and 'Administration OR the currently assigned approver can edit records during the approval process.' At the bottom right, there are four buttons: 'Previous', 'Save', 'Next', and 'Cancel'.

Step 3: Email Template

Implementation snapshot: approval-step configuration evidence.

9.3 Client Reminder Flow

The reminder automation is designed as a record-triggered flow on Event. When the event is Confirmed, a scheduled path is placed three days before Event Date. The flow composes a subject/body and sends the message to the client, with the owner included where required.

Flow element	Configuration
Object	Event__c
Trigger	Created or updated
Condition	Event Status = Confirmed
Scheduled path	3_Days_Before
Time source	Event Date
Offset	3 days before
Action	Send Email

9.4 Reminder Flow Snapshot

The reminder flow is kept separate from the approval process so that communication timing is easier to test and maintain.

2. Select the Record Triggered flow. Click on create.

Implementation snapshot: scheduled-path and flow configuration evidence.

10. Apex Business Logic

Apex is used where the requirement depends on comparing or updating multiple records. The main classes/triggers cover venue availability, booking conflict detection and automatic completion of past events.

Component	Type	Responsibility
VenueStatusHelper	Apex class	Update Venue availability when event status changes.
EventTrigger13	After insert/update trigger	Invoke venue-status logic after Event changes.
PreventDoubleBooking	Before insert/update trigger	Block conflicting venue/date combinations.
BatchCompleteEvents	Batch Apex	Mark past non-completed events as Completed.
ScheduleCompleteEvents	Schedulable Apex	Run the batch on a scheduled basis.

10.1 Venue Status Helper Snapshot

When a confirmed event uses a venue, the helper sets the venue availability to Reserved. When the event is canceled, the venue can return to Available.

```
public with sharing class VenueStatusHelper {  
    public static void updateVenueStatus(List<Event__c> events){  
        List<Venue__c> venues = new List<Venue__c>();  
        for(Event__c ev : events){  
            if(ev.Venue__c != null){  
                if(ev.Event_Status__c == 'Confirmed'){  
                    venues.add(new Venue__c(Id=ev.Venue__c, Availability_Status__c='Reserved'));  
                } else if(ev.Event_Status__c == 'Canceled'){  
                    venues.add(new Venue__c(Id=ev.Venue__c, Availability_Status__c='Available'));  
                }  
            }  
        }  
        if(!venues.isEmpty()) update venues;  
    }  
}
```

5. Save the class using CTRL+S

Now Create Trigger For this Class :

Implementation snapshot: Apex class and Developer Console evidence.

10.2 Double-Booking Validation Snapshot

The conflict check collects venue IDs, queries related events once, groups them by venue and compares the event date. A conflicting record receives an addError message instead of being saved.

```
trigger EventTrigger13 on Event__c (after insert, after update) {  
    VenueStatusHelper.updateVenueStatus(trigger.new);  
}
```

Milestone 9 – Apex Trigger

Activity 1:

Scenario: Do not allow two events at the same Venue on the same Date.

Create an Apex Trigger:

1. Click on File and Click New and Click on Apex Trigger

Implementation snapshot: trigger logic evidence.

10.3 Batch Completion Snapshot

BatchCompleteEvents searches for past events that are not already Completed.
ScheduleCompleteEvents invokes the batch using a scheduled Apex job.

```
1 // Trigger PreventDuplicate as Event__c (Before insert, before update) {
2     Set<Id> result = new Set<Id>();
3     for(Event__c ev : Trigger.new){
4         if(ev.Venue__c != null) result.add(ev.Venue__c);
5     }
6
7     Map<Id, List<Event__c>> resultMap = new Map<Id, List<Event__c>>();
8     for(Event__c e : [SELECT Id, Venue__c, Event_Date__c
9         FROM Event__c WHERE Venue__c IN :result]);
10         if(resultMap.containsKey(e.Venue__c)){
11             resultMap.put(e.Venue__c, new List<Event__c>());
12         }
13         resultMap.put(e.Venue__c, add(e));
14     }
15
16     for(Event__c ev : Trigger.new){
17         if(ev.Venue__c != null) {
18             if(resultMap.containsKey(ev.Venue__c)){
19                 for(Event__c existing : resultMap.get(ev.Venue__c)){
20                     if(existing.Event_Date__c < ev.Event_Date__c || existing.Id != ev.Id){
21                         ev.addError('This Venue is already booked on this date. ');
22                     }
23                 }
24             }
25         }
26     }
27 }
```

Milestone 10: Batchable and Schedulable Asynchronous Apex

Scenario: Mark all past events as Completed every night.

Step 1: Create Batch Apex Class:

1. Click Gear Icon and Select Developer Console
2. Click on File and Click New and Click on Apex class
3. Give name as BatchCompleteEvents and Click Ok
4. Write your Apex Class Code

Source Code:

```
global class BatchCompleteEvents implements Database.Batchable<SObject> {
    global Database.QueryLocator start(Database.BatchableContext bc){
        return Database.getQueryLocator(
```

Implementation snapshot: batch/scheduled Apex evidence.

11. Lightning UI, Reports & Dashboard

A dedicated Lightning app groups the main objects and analytics in one navigation menu. The user experience is intended to minimize context switching: event records, client information, vendor assignments, venue details and feedback can be reached from the same workspace.

Navigation	Purpose
Event	Create, update and monitor event records.
Client	Maintain client contact and location information.
Vendor	Maintain vendor service and status information.
Venue	Track capacity and availability.
Feedback	Capture post-event rating and comments.
Reports	Run operational analysis.
Dashboards	View summarized metrics.

11.1 Lightning App Snapshot

The application is configured with Event, Client, Vendor, Venue, Feedback, Reports and Dashboards as the main navigation items.

From Setup, enter App Manager in the Quick Find and select App Manager.

Implementation snapshot: Lightning App Manager configuration.

11.2 Upcoming Events by Month Report

The report is designed to show future events grouped by calendar month. Useful columns include Event Name, Event Date, Event Type, Client, Venue and Event Budget. The report can use a TODAY/next-30-days style filter and exclude canceled events.

Report setting	Configuration
Name	Upcoming Events by Month
Rows	Group Event Date by Calendar Month
Summary	Row count + Event Budget total
Filter	Future events; canceled events excluded
Chart	Column or line chart by month

11.3 Report Configuration Snapshot

The report is intended for monthly scheduling and budget visibility rather than as a generic record list.

3. Select the Category as All, search for Events or Events with Client & Venue, select it, and click Start Report.
4. In the outline pane, select the fields mentioned below in the Columns section:
 - Event Name
 - Event Date
 - Event Type
 - Client__r.Name
 - Venue__r.Name
 - Event_Budget__c
5. Remove any unnecessary fields.
6. Toggle Update Preview Automatically.

Implementation snapshot: report-building evidence.

11.4 Operations Dashboard Snapshot

The dashboard is named EventForce Operations Dashboard and uses the report as a visual component for upcoming-event visibility.

2. Click on New Dashboard.
3. Give name – EventForce Operations Dashboard.
4. Click Create.
5. Click on +Widget.
6. Select the Upcoming Events by Month Report.
 - o Chart: Donut Chat
 - o Max Values Displayed: 6
 - o Subtitle: Upcoming Events Overview
 - o Widget Theme: Light
 - o Click save

Implementation snapshot: dashboard/widget evidence.

12. Data Migration & Security

Before loading data, the implementation uses a pre-validation step to reduce duplicate or inconsistent records. Events, Clients, Vendors, Venues and Feedback are the primary migration scope.

Migration sequence

- Prepare source data and standardize required values.
- Validate relationships and remove duplicate rows.
- Load parent records before dependent relationship records.
- Verify lookup/master-detail mappings.
- Run sample checks before full import.
- Confirm automation and permissions after migration.

Security model

Control	Configured approach
Profiles	Event Admin, Event Coordinator, Vendor Manager, Client Profile
Roles	Event Admin → Event Coordinator / Vendor Manager / Client
Permission Set	Feedback Manager with additional Feedback access
OWD	Event object configured as Private
Sharing	Event_Sharing_For_Vendors extends read access to Vendor Manager role

12.1 Profile Configuration Snapshot

Profiles are used to define baseline object access. The reference implementation differentiates the Event Admin, Event Coordinator, Vendor Manager and Client roles.

Clone Profile

Enter the name of the new profile.

You must select an existing profile to clone from.

Existing Profile	System Administrator
User License	Salesforce
Profile Name	Event Admin

via Integration User
ud Integration User

3. Select Existing Profile as 'System Administration'.
4. Enter Profile Name as 'Event Admin'.
5. Click On save.

Implementation snapshot: profile configuration evidence.

12.2 Vendor Manager Access Snapshot

The Vendor Manager profile is focused on vendor maintenance with read visibility into related event, venue, client and feedback information.

Create a Custom profile:

1. From setup, enter profiles in Quick Find box
2. Click On New Profile.
3. Select Existing Profile as 'Standard Platform User'.
4. Enter Profile Name as '**Vendor Manager**'.
5. Click On save.
6. Click On Edit
7. Select the Custom App settings as default for the Event Planner.

8. Scroll down to Custom Object Permissions Give Access:
Vendor: CRED

Event: Read Only

Venue: Read Only

Client: Read Only

Implementation snapshot: role-specific permission evidence.

12.3 Role Hierarchy Snapshot

The role hierarchy places Event Admin above the operational roles so that record access can follow the intended reporting structure.

to show the steps from above activity.

Activity 4: Creating other Role Under Event Admin Role

- 1.Create Another Role.
- 2.Create a Role with the Name "**Client**".
- 3.Below the Event Admin click on add role and enter the label name as a "**Client**" and role name, will be Automatically populated and click on save.
- 4.Follow the steps from above Activity.

Milestone 16 -User:

What is a user?

A user is anyone who logs in to Salesforce. Users are employees at your company, such as sales, reps, managers, and IT specialists, who need access to the company's records. Every user in Salesforce has a user account. The user account identifies the user, and the user account settings determine what features and records the user can access.

Implementation snapshot: role setup evidence.

12.4 Sharing Configuration Snapshot

The Event_Sharing_For_Vendors rule shares Event records from the Event Coordinator role to the Vendor Manager role with read-only access.

3. Give the Label name as “ Event_Sharing_For_Vendors”
4. Rule name is auto populated.
5. In step 3 : Select which records to be shared, members of “ Roles ” >> “ Event Coordinator”
6. In step 4: share with, select “ Roles ” >> “ Vendor Manager ”
7. In step 5 : Change the access level to “ Read Only ”.
8. Click on Save.

Implementation snapshot: sharing-rule evidence.

13. Testing and Validation

Testing covers configuration, automation, Apex behavior, data accuracy, security and analytics. The goal is not only code coverage; each business rule should produce the expected user-visible result.

Test ID	Scenario	Expected result
T01	Create valid event	Event saves successfully.
T02	Create event with invalid client email	Validation message prevents save.
T03	Confirm event with venue	Venue becomes Reserved.
T04	Cancel event	Venue becomes Available after the cancellation logic.
T05	Create same venue/date combination	Second conflicting event is blocked.
T06	Submit cancellation	Approval request is created.
T07	Approve cancellation	Event moves to Canceled and notification action occurs.
T08	Reject cancellation	Event follows the rejection path.
T09	Past event batch	Eligible past events become Completed.
T10	Reminder schedule	Confirmed event is eligible for 3-day reminder.
T11	Role access	Users see only the records/objects allowed by configuration.
T12	Report/dashboard	Upcoming-event information is summarized correctly.

13.1 Testing Evidence and Readiness

The implementation is designed to be tested in a Salesforce Developer Edition. The source project states that production deployment was not performed; therefore this document treats production readiness as a future activity rather than claiming a production deployment.

Verification checklist

- Objects and relationships created and accessible.
- Validation rules reject invalid data.
- Reminder flow activates only for appropriate confirmed events.
- Approval process follows the intended entry, approval and rejection paths.
- Apex logic handles bulk records without SOQL/DML inside loops.
- Reports show the expected event population.
- Security settings match the documented roles and sharing model.
- Imported records preserve relationship integrity.

14. Outcomes, Limitations & Future Scope

Key outcomes

- Centralized event-management data in Salesforce.
- Reduced manual steps through flows and approvals.
- Venue conflicts addressed through Apex validation.
- Clear operational visibility through reports and dashboards.
- Role-based access and sharing controls documented.
- Data migration and testing treated as part of the implementation rather than as afterthoughts.

Known limitations

- The implementation was developed and tested in Salesforce Developer Edition.
- Production deployment was not performed as part of the project.
- Real-world deployment may require Salesforce DX, Change Sets, sandbox validation or CI/CD tooling.
- Flows, Apex, approvals and sharing settings require ongoing monitoring and maintenance.

14.1 Future Scope

- Production deployment through a controlled release process.
- Advanced event automation for additional planning stages.
- Expanded vendor performance tracking.
- More detailed analytics across events, venues, vendors and feedback.
- Integration with external event, payment or communication services where required.
- Improved mobile accessibility.
- Scalability enhancements for larger record volumes and user populations.
- Continuous optimization of flows, Apex, validations and sharing.

Project direction

The current solution establishes the core CRM foundation; future iterations can add integrations, deeper analytics and stronger operational automation without replacing the central data model.

15. Appendix — Implementation Reference

Category	Components
Custom Objects	Event__c, Client__c, Vendor__c, Venue__c, Feedback__c, EventVendor__c
Relationships	Event→Client, Event→Venue, Feedback→Event, Feedback→Client, EventVendor→Event/Vendor
Flows	Client Reminder – 3 Days Before
Approval	Event_Cancellation_Process
Apex	VenueStatusHelper, EventTrigger13, PreventDoubleBooking, BatchCompleteEvents, ScheduleCompleteE
Security	Profiles, Roles, Permission Set, OWD, Sharing Rule
Analytics	Upcoming Events by Month, EventForce Operations Dashboard
Migration	Salesforce Data Import Wizard
Testing	Configuration, automation, Apex, data accuracy, security, reports/dashboard

Suggested GitHub structure

Folder	Contents
force-app/main/default/classes	Apex classes and test classes
force-app/main/default/triggers	Event triggers
objects	Custom object and field metadata
flows	Flow metadata
approvalProcesses	Cancellation approval metadata
permissionsets / profiles / roles	Security configuration
reports / dashboards	Analytics metadata
docs	Final project document and supporting notes
