

EVENTFORCE MANAGEMENT SYSTEM

PHASE 4

Data Migration, Testing & Security

Data loading, validation, functional testing and access control

Elaborated Salesforce Implementation Document

Prepared as a detailed, project-specific submission document

1. Phase Overview

Prepare and validate data, confirm system behavior and establish controlled access across the EventForce Salesforce implementation.

2. Data Migration Objective

The data migration stage prepares the EventForce org for realistic operational use by loading structured records into the custom objects and verifying that relationships and data quality are preserved. The documented implementation uses Salesforce Data Import Wizard for migration activities.

3. Migration Scope

Object	Migration role
Client	Parent/reference data for event coordination.
Venue	Venue records used by event bookings.
Vendor	Vendor records used for event assignments.
Event	Primary operational records with client and venue relationships.
Feedback	Feedback records associated with events and clients.
EventVendor	Dependent junction records connecting events and vendors.

4. Migration Sequence

- Prepare source data and standardize field values.
- Check required fields and formats.
- Validate duplicate or conflicting rows.
- Load parent/reference records before dependent relationship records where required.
- Verify lookup and master-detail references.
- Run sample checks before wider import.
- Confirm that automation and permissions behave correctly after data loading.

5. Data Quality Controls

Control	Purpose
Required values	Avoid incomplete event and master records.
Email validation	Improve contact-data consistency.
Relationship checks	Preserve Event → Client and Event → Venue references.
Venue/date validation	Reduce conflicting bookings.
Post-import verification	Confirm records and relationships after loading.

6. Testing Strategy

Test category	What is checked
Configuration testing	Objects, fields, relationships and required settings.
Automation testing	Reminder Flow and approval behavior.

Test category	What is checked
Apex testing	Venue availability, double-booking and status-processing behavior.
Data testing	Imported values, references and relationship integrity.
Security testing	Profiles, roles, permission sets, OWD and sharing.
Analytics testing	Reports and dashboards display expected operational information.
Performance / processing	Batch and scheduled jobs process eligible records as intended.

7. Functional Test Scenarios

Scenario	Expected result
Create valid event	Event record is accepted and related Client/Venue can be selected.
Enter invalid data	Relevant validation prevents the invalid save.
Book same venue/date twice	PreventDoubleBooking blocks the conflicting record.
Submit Pending Cancellation	Approval process starts for the eligible Event.
Approve cancellation	Event status changes to Canceled and configured notification is sent.
Reject cancellation	Configured rejection status/notification behavior occurs.
Past event processing	Batch/scheduled logic marks eligible past events Completed.
Open report	Expected upcoming event population appears.
Check restricted access	User sees only the records/functions allowed by the security model.

8. Security Model

Security control	Documented EventForce configuration
Profiles	Event Admin, Event Coordinator, Vendor Manager and Client-oriented access.
Roles	Event Admin, Event Coordinator, Vendor Manager, Venue Manager and Client.
Permission Sets	Additional access can be provided without changing the base profile.
OWD	Event object configured as Private.
Sharing Rule	Event_Sharing_For_Vendors extends read access from Event Coordinator records to Vendor Manager role.
Role hierarchy	Supports record visibility based on organizational responsibility.

9. OWD Configuration

- Open Setup → Sharing Settings.
- Locate the Event object.
- Configure Default Internal Access as Private.
- Configure Default External Access as Private according to the documented project configuration.
- Save the sharing settings.
- Use sharing rules only to extend access where the business requirement calls for it.

10. Event_Sharing_For_Vendors

- Create a sharing rule for the Event object.
- Label: Event_Sharing_For_Vendors.
- Share records owned by the Event Coordinator role.
- Share with the Vendor Manager role.
- Set the access level to Read Only.
- Save and verify the sharing behavior with a suitable test user.

11. Testing Evidence & Readiness

The documented project states that screenshots were captured to validate record creation, trigger behavior, batch processing, scheduled reminders and dashboard analytics. Security testing should additionally verify that the configured access model behaves as documented.

12. Phase Outcome

- Data migration approach is defined and aligned with the custom-object model.
- Functional, automation, Apex, data and security testing areas are documented.
- Event OWD and vendor sharing behavior are documented.
- The implementation is positioned for controlled future deployment, subject to production release activities.

Implementation Evidence

The following selected visuals are included as supporting implementation evidence. The document layout and narrative are reorganized for a distinct phase-wise submission.

Milestone 10: Batchable and Schedulable Asynchronous Apex

Scenario: Mark all past events as Completed every night.

Step 1: Create Batch Apex Class:

1. Click Gear Icon and Select Developer Console
2. Click on File and Click New and Click on Apex class
3. Give name as BatchCompleteEvents and Click Ok
4. Write your Apex Class Code

Source Code:

```
global class BatchCompleteEvents implements Database.Batchable<SObject> {  
    global Database.QueryLocator start(Database.BatchableContext bc){  
        return Database.getQueryLocator(  
            'SELECT Id FROM Event WHERE CreatedDate <= :{0} ORDER BY CreatedDate'        );  
    }  
    Database.Batchable.SObjectList execute(Database.BatchableContext bc, List<Id> ids){  
        List<Event> events = new List<Event>();  
        for (Id id : ids) {  
            Event e = new Event();  
            e.Id = id;  
            e.Status = 'Completed';  
            events.add(e);  
        }  
        return events;  
    }  
}
```

Security configuration evidence.

Create a Custom profile:

1. From setup, enter profiles in Quick Find box
2. Click On New Profile.
3. Select Existing Profile as 'Standard Platform User'.
4. Enter Profile Name as '**Vendor Manager**'.
5. Click On save.
6. Click On Edit
7. Select the Custom App settings as default for the Event Planner.

8. Scroll down to Custom Object Permissions Give Access:
Vendor: CRED

Event: Read Only

Venue: Read Only

Client: Read Only

Data / testing configuration evidence.

Appendix — Phase Checklist

- Migration sequence documented.
- Data quality checks documented.
- Functional and automation tests documented.
- Apex and scheduled-processing tests documented.
- Profiles and roles documented.
- Event OWD configured as Private.
- Vendor sharing rule documented.
- Testing evidence and readiness notes included.
